Always beautiful summer evenings!

Anyone who wishes to enjoy life outside for longer throughout the year may consider a patio roof. This makes the summer evenings very comfortable and keeps your valuable garden furniture and cushions nice and dry. In short, a pleasant addition to your living comfort.

The Van Boven patio roof is available in various standard sizes. This patio roof consists of aluminium sections, as standard enamelled in the colours white (RAL 9010) or anthracite grey (RAL 7016), in combination with polycarbonate hollow-core sheets. For people with DIY experience, it can be easily installed.

Depths

You can choose between 2 depths: 210 or 310 cm. For 210 cm a 10 mm hollow-core sheet is used and for 310 cm a 16 mm hollow-core sheet.

LED lighting

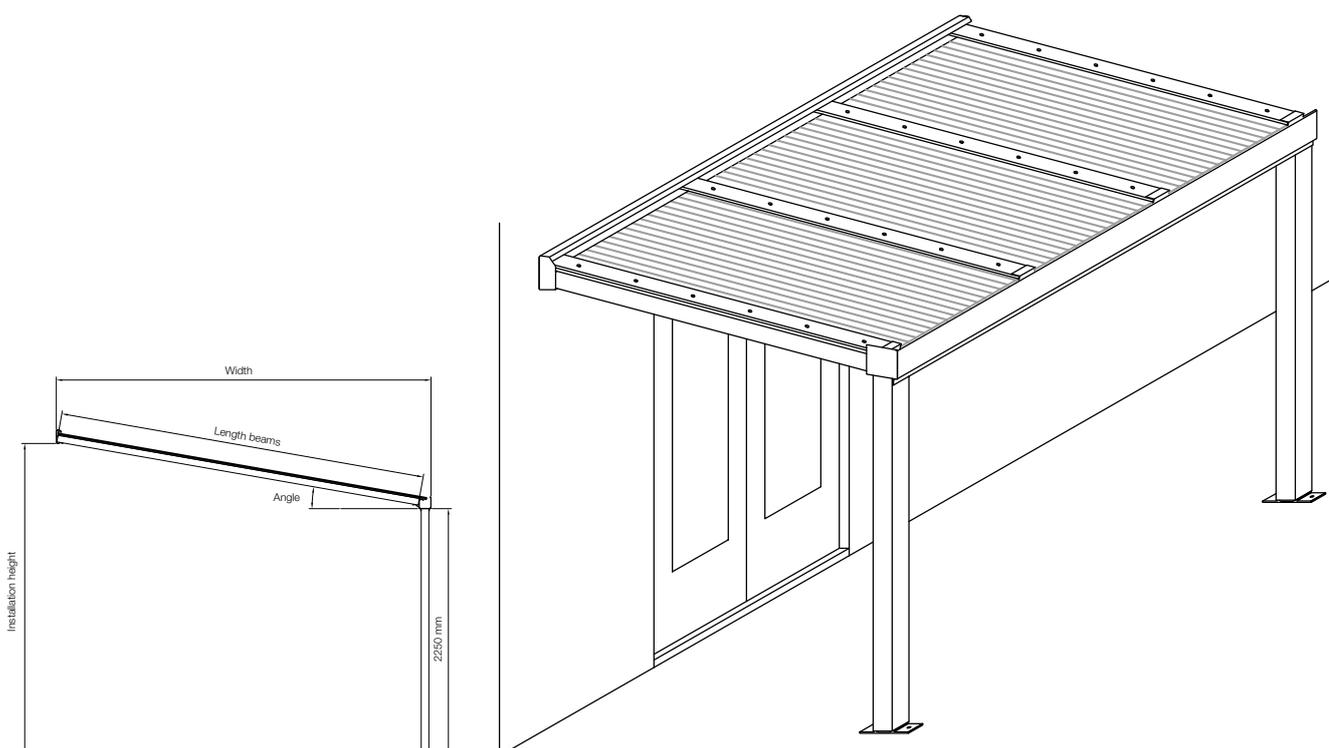

The patio roofs can be fitted with energy-efficient LED lighting. This is controlled by a universal LED adapter, to which a maximum of 5 LED lights can be connected.

Solid acrylate or polycarbonate sheets

The patio roofs are designed as standard with polycarbonate hollow-core sheets in the colours clear or opal. The thickness is determined depending on the span. For a span of 2100 mm a thickness of 10 mm is usually applied and for a span of 3100 mm a thickness of 16 mm. In addition, the Van Boven patio roofs can also be designed with acrylate or polycarbonate solid sheeting in the colours clear or opal.

Side walls

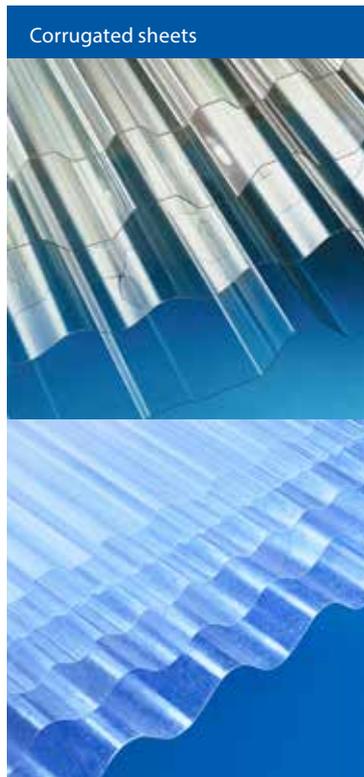

The patio roofs can be easily expanded with side walls. These offer additional protection from wind, making every summer evening wonderful. For technical support and for pricing, please contact Van Boven Project Constructions.

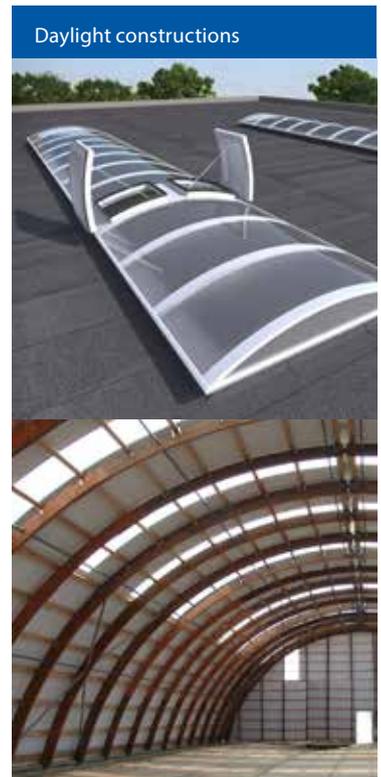

Van Boven Kunststoffen: Perfection in daylight

Perfection down to the smallest detail

Quality in customisation

Shapes in daylight

High-performance synthetic materials provide limitless possibilities.

In modern architecture, daylight plays an important role. The natural colours of daylight are used to give a building atmosphere and character. Van Boven is considered a pioneer in the field of synthetic building products and has grown into one of the most important producers of synthetic daylight products. Translucent synthetic products are supplied for almost any application. From a single-walled polyester corrugated sheet to a daylight construction with multi-walled polycarbonate sheeting.
